GW170817: Welcome to the Multi-messenger Era

GW170817

Object: BNS

Total mass: $2.74M_{\odot}$

Distance: 40 Mpc

GW Radiation: $0.025M_{\odot}$

GW Duration: 100 s

Galaxy: NGC-4993

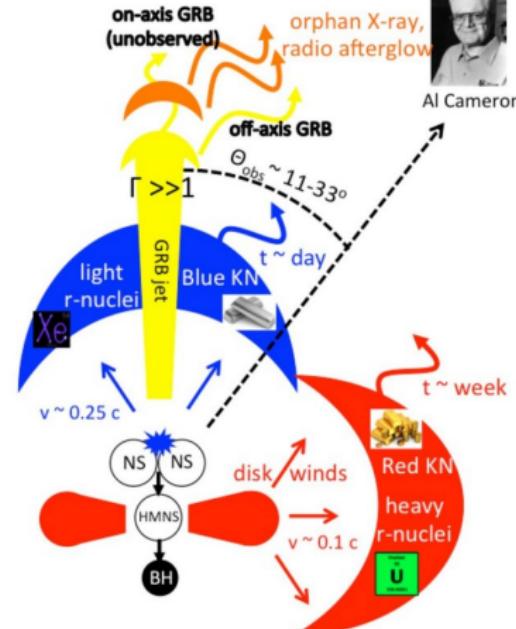

GW170817 Science

- short gamma ray burst
- kilonova (optical → radio)
- neutrinos (none-found)
- r-process nuclei
- speed of gravity
- EOS constraints
- H_0 constraints

on-axis GRB (unobserved)
off-axis GRB
 $\theta_{\text{obs}} \sim 11-33^{\circ}$
 $\Gamma \gg 1$
 $t \sim \text{day}$

Al Cameron

[arXiv:1710.05931]

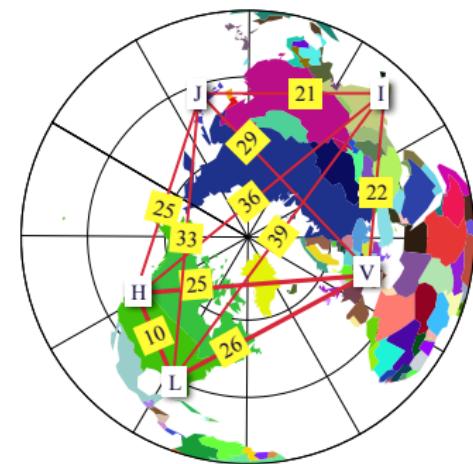

Next-Generation Gravitational Wave Astronomy

Next Generation GW
Astronomy

Detector network by ≈ 2026

- LIGO A+ (Washington State)
 - LIGO A+ (Louisiana)
 - aVIRGO (Italy)
 - GEO-HF (Germany)
 - KAGRA (Japan)
 - LIGO-India

[Sathyaprakash 2014]

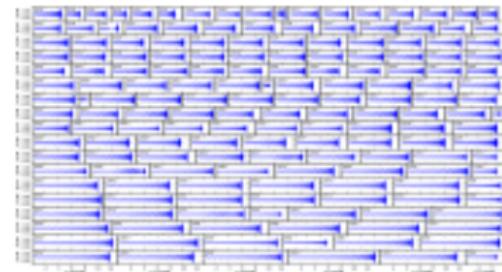

Expected NSNS Detection Rate

1-10 NSNS mergers detected per **week**

Numerical Relativity

- Numerical relativity is critical for the LIGO search pipeline and parameter estimation. LIGO uses SpEC for BBH.
- The Spectral Einstein Code (SpEC;black-holes.org) is a multi-domain spectral code for solving the Einstein field equations written primarily by Larry Kidder, Harald Pfeiffer and Mark Sheel.
- SpEC is now developed at 9 different universities which compose the SXS collaboration. The SXS collaboration just released a catalog of 2018 waveforms.

[arXiv:1904.04831]

Numerical Relativity: Two Problems

Problem 1

- Currently no code can handle multi-scales/microphysics required for all realistic simulations (10cm for MRI, 1-2000km for GW).
- Current Spectral codes have problems with discontinuities in EOS phase transitions.
- Supercomputers are becoming exascale in 2020 and SpEC doesn't scale very well.

Chapter 2

Develop a new code using new more powerful numerical techniques for problems in numerical relativity.

Problem 2

- The gravitational network will be detecting 1-10 BNS per week.
- No large catalogs of BNS simulations with realistic microphysics to maximize science.

Chapter 3

Add to the ongoing effort by running and analyzing a set of BNS simulations with some of the most realistic microphysics available.

Chapter 2: Next generation Numerical Relativity

SpECTRE: A Task-based Discontinuous Galerkin Code for Relativistic Astrophysics

Lawrence E. Kidder^a, Scott E. Field^{a,b}, Francois Foucart^c, Erik Schnetter^{d,e,f}, Saul A. Teukolsky^a, Andy Bohn^a,
Nils Deppe^a, Peter Diener^{f,g}, Fran ois H ebert^a, Jonas Lippuner^h, Jonah Miller^{e,d}, Christian D. Ott^h,
Mark A. Scheel^h, Trevor Vincent^{i,j}

Science Goals

- GR-Radiation-MHD
- Realistic EOS
- BNS and Supernova

Computational Goals

- discontinuous Galerkin.
- Exascale.
- Open Source.

[arXiv:1609.00098]

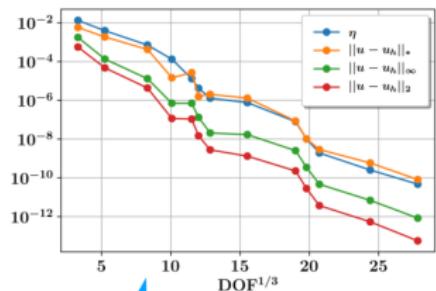

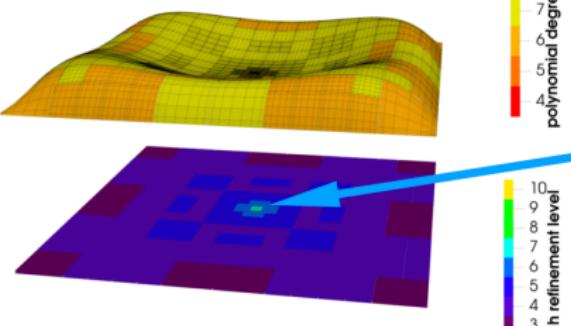

Test Problem 1: Single Non-smooth point

- Spectral methods, **smooth** solutions

$$\text{error} < C_1 e^{-C_2 \text{DOF}^{1/d}}$$
 - hp-refined DG-grids can achieve

$$\text{error} \leq C_1 e^{-C_2 \text{DOF}^{1/(2d-1)}}$$

even with non-smooth solutions (Schötzau+ 14)

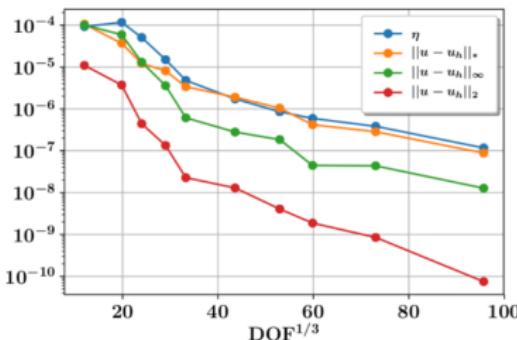

C⁴ discontinuity does not spoil exponential convergence

Test Problem 2: Constant Density Star

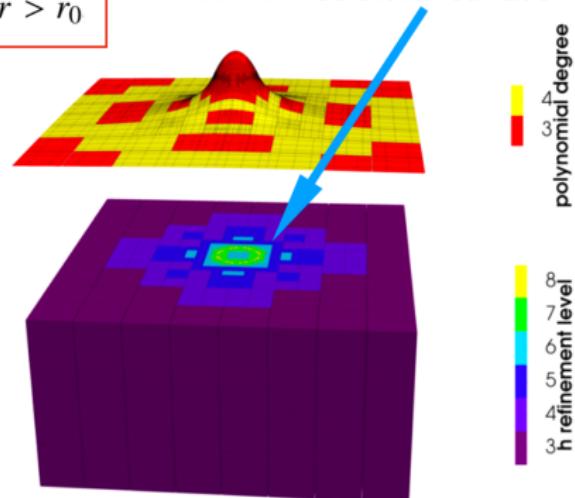

- Hamiltonian constraint

$$\nabla^2 \psi + 2\pi \rho \psi^5 = 0, \quad \rho = \begin{cases} \rho_0 & r \leq r_0 \\ 0 & r > r_0 \end{cases}$$

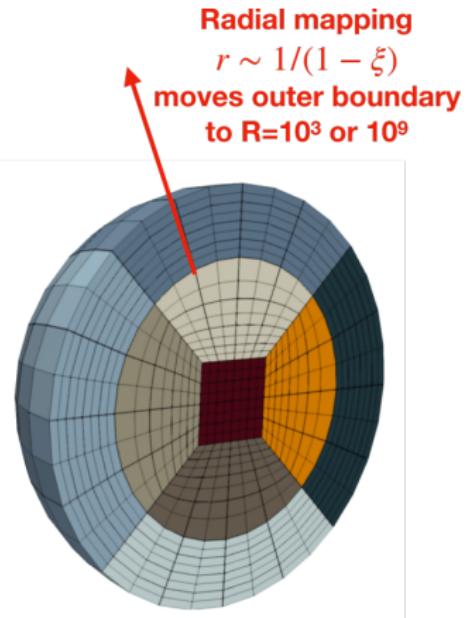

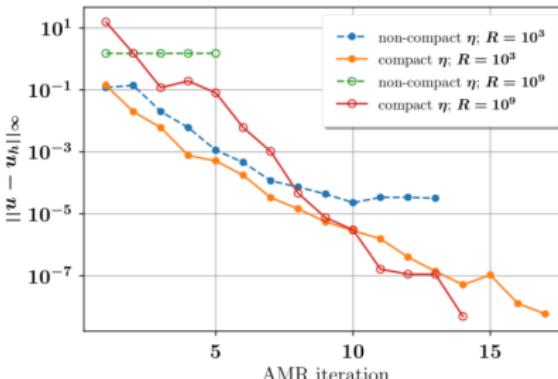

3-d cubic grid
not adapted to geometry

AMR finds stellar surface

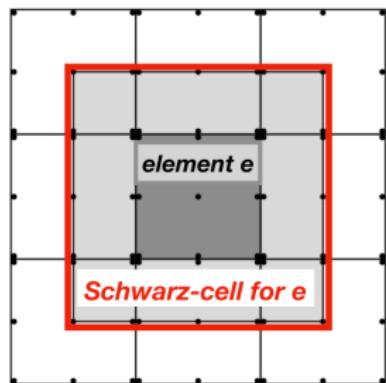

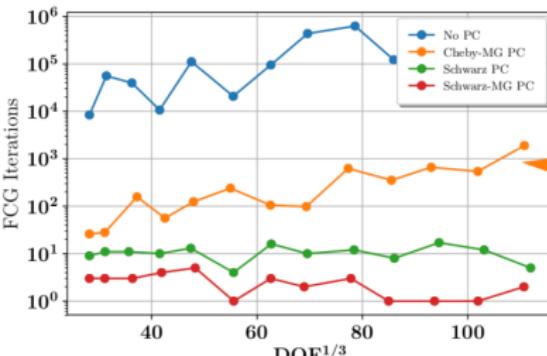

Test Problem 3: Compactified Cubed-Spheres

- Two ‘spherical’ layers required
 - inner one transitions to sphere
 - outer one compactified
- Must also ‘compactify’ η

Test Problem 3: Compactified Cubed-Spheres

- Multi-grid with Schwarz smoother
 - Uses solutions of per-element linear systems

Chebyshev smoother: iteration count increases
Schwarz smoother (w/o and w/ multi-grid)

Two Punctures: Old Code vs New Code

Equal Mass Binary Black Hole Initial Data

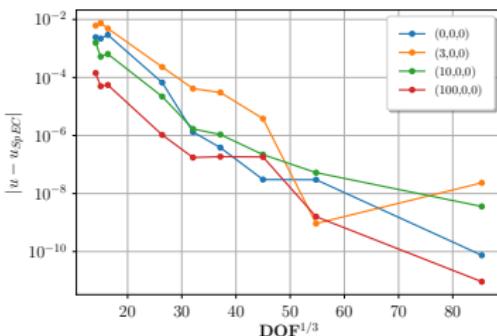

$$-\nabla^2 u = \frac{1}{8} \bar{A}^{ij} \bar{A}_{ij} \psi(u)^{-7}$$

$$u = 0 \quad r = \infty$$

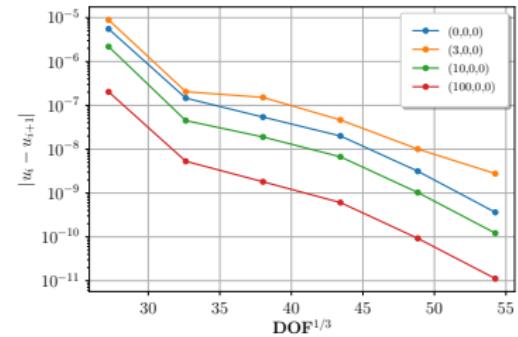

$$\vec{x}_\pm = (\pm 3, 0, 0) \quad \vec{P}_\pm = (0, \pm 2, 0)$$

Mesh: Cubed Sphere with $R = 10^{11}$

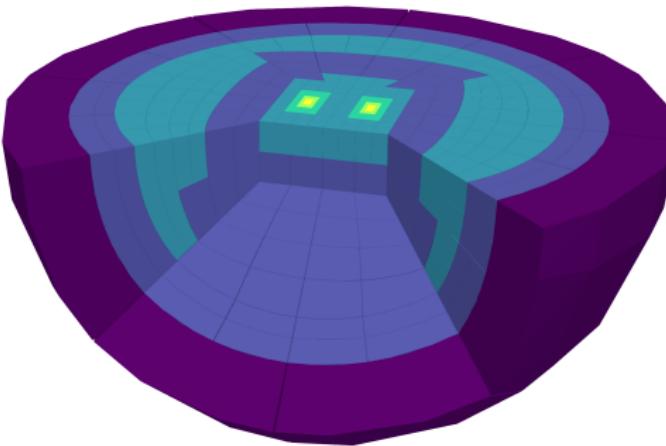

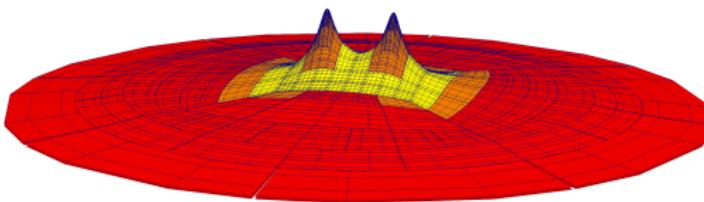

[dG]

[SpEC]

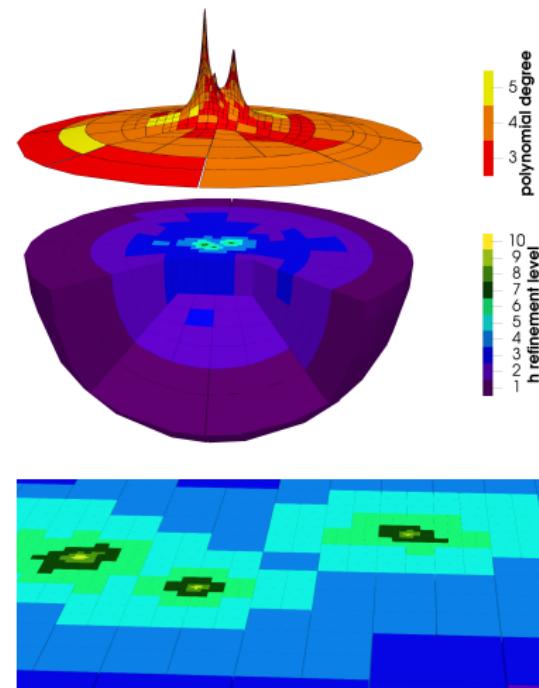

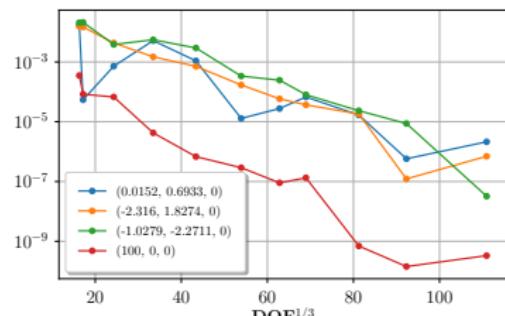

Two Punctures: Old Code vs New Code

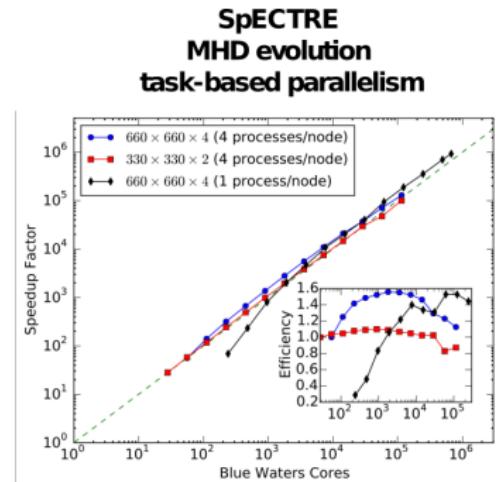

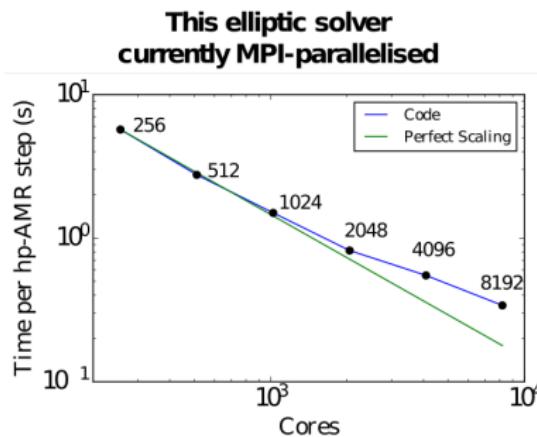

Random Three Punctures: New Code only

	Puncture 1	Puncture 2	Puncture 3
m	0.2691	0.4063	0.3245
x	0.0152	-2.316	-1.0279
y	-0.6933	1.8274	-2.2711
P_x	0.0585	-0.0284	0.1640
P_y	0.0082	-0.1497	0.0515
S_z	-0.0134	-0.0332	-0.0708

Scalability

Kidder+ JCP, arXiv:1609.00098

Conclusions and Future work

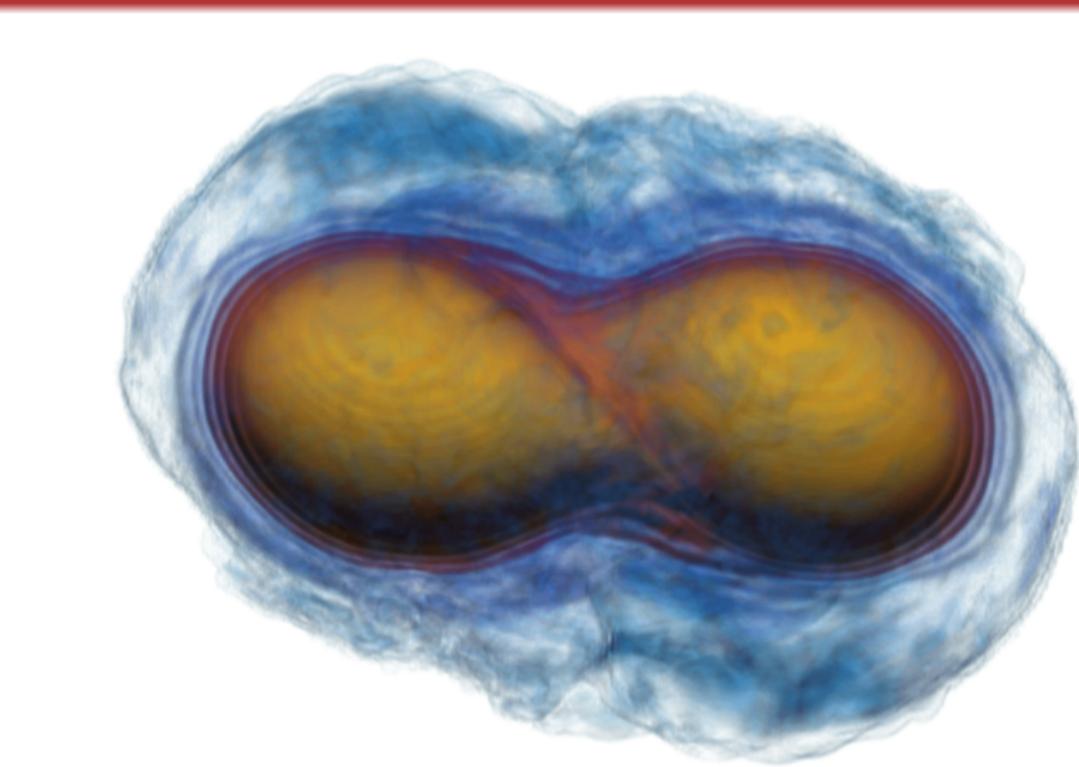

Conclusions:

- First dG code for elliptic problems in NR
- First dG scheme for curved, stretched nonconforming grids
- First demonstration of a Multigrid + Schwarz solver with dG on non-trivial grids
- dG appears to show excellent promise
- Submitted to PRD [arXiv:1907.01572]

Future work:

- port into the task based parallel SpECTRRe code
- Binary Neutron Star initial data

Chapter 3: Unequal Mass BNS w/ Neutrino Transport

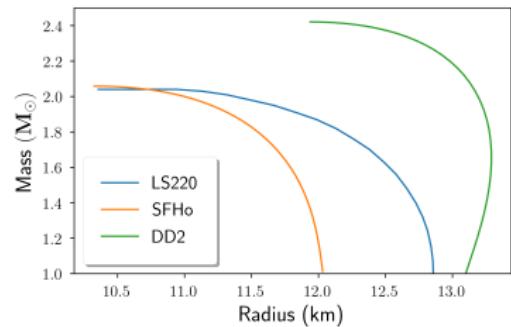

Merging DD2 $1.44M_{\odot} + 1.44M_{\odot}$ binary

Chapter 3: Unequal Mass BNS + Neutrino Transport

- SFHo has the most ejecta
- Collapse runs produce no ejecta
- Ejecta is mostly equatorial

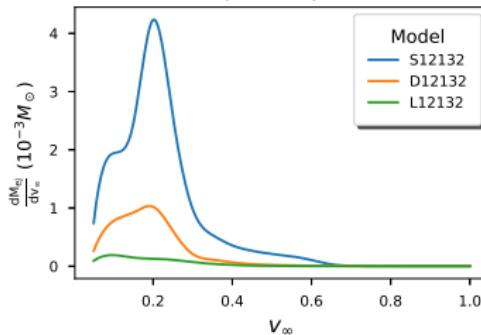

Secular Ejecta

- GW170817 $M_{ej} \sim 0.05M_{\odot}$
- 40% of disk mass can get ejected [arXiv:1808.00461]

regions, tail and disk.

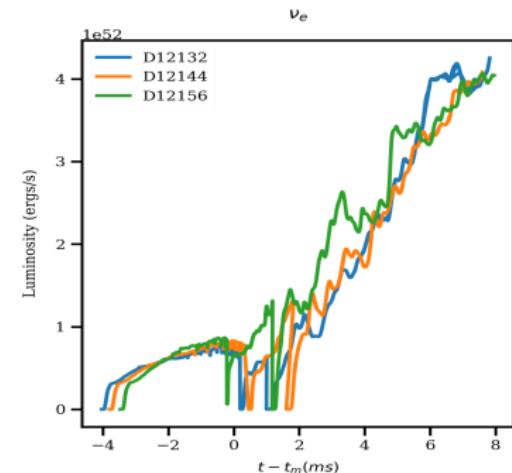

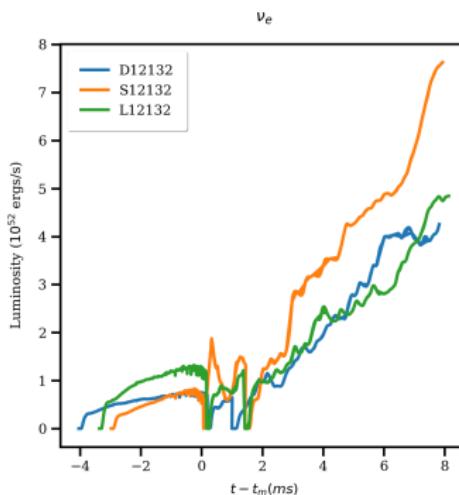

D12132

D144144

Neutrino Emission

- SFHo has largest luminosity
- No Dependence on mass-ratio

Conclusions and Future work

Conclusions:

- 12 new simulations used in two studies so far
[arXiv:1808.03836; arXiv:19XX.XXXX]
- Collapse models → no ejecta, small disk mass
- Softest model has most ejecta $\sim .01 M_{\odot}$
- Broad Y_e distribution, mean 0.2 increasing over time
- Broad v_{∞} distribution, mean 0.2-0.3c decreasing with binary asymmetry
- Disk masses increase with binary-asymmetry and stiffness
- Neutrino emission dominated by SFHO, no dependence of emission/morphology on mass-ratio.

Future work:

- Continue collapse runs, Long-term evolution runs
- MHD/Spins/Different EOS/Neutrino improvements
